Nagios Fusion

• Quickly identify and solve problems on an infrastructure-wide basis before they affect critical business processes.

• Gain insight into the health of your organization's entire network through a centralized view of your infrastructure.

• Tactical overview screens display the status of hosts and services monitored by all Nagios Core and Nagios XI servers deployed throughout your organization, enabling faster problem detection and resolution.

With Nagios Fusion, you'll never be left having to explain why an unseen infrastructure outage hurt your organization's bottom line.

Centralized View

Provides IT operations staff and management with quick, at-a-glance visual indication of problems anywhere across your IT infrastructure.

De-Centralized Management

Allows geographically separated teams to manage their own individual monitoring servers, while providing central operations staff with access to all servers.
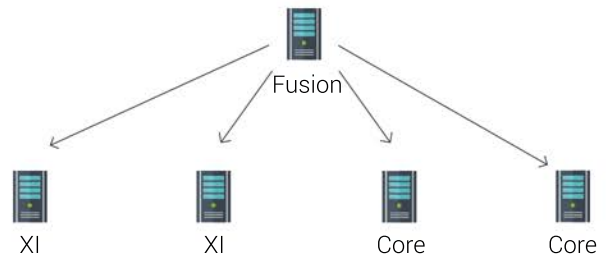

Monitoring Made Easy

Alleviates the need for complex configurations, data transfer problems, having to manage changes on both central and distributed nodes.

Comprehensive Server

Integrates with both Nagios Core and Nagios XI monitoring servers to provide infrastructure-wide visibility.

Scalability Without Limits

Designed with unlimited scalability in mind. Remote Nagios servers distribute the load associated with monitoring and performance graphing. As your infrastructure grows, your monitoring environment can expand without increasing load or management requirements at the central node.

Simple Connectivity

Remote monitoring servers need only be accessible via HTTP or HTTPS, removing the need for dedicated VPN links and custom firewall rules.

Outage Visibility

Provides IT staff with a global view of monitoring server operations, making it easy to spot remote server outages and initiate remedial failover operations.

Fusion

XI   XI   Core   Core

Failover Protection

Multiple Fusion servers can be easily deployed to provide a global view from multiple geographic locations.

Managed Service Bliss

Distributed operation allows Managed Service Providers (MSPs) to easily keep tabs on monitoring servers installed at their clients' remote locations without the overhead or complexity of persistent VPN connections.
